

Meet Natally.

The conversational interface for natal astrology and synastry.

Built on Tauri 2 | AGPL-3.0 Open Source

The Interface Inversion

The chatbot isn't a feature. The chatbot is the UI.

The Old Way

No sprawling menus. No generic text boxes.

The Natally Way

Charts are things she shows you while she talks.

Designing a Companion, Not a Calculator

01. The Persona

Warm, companion-led interactions designed to meticulously emulate a real-time, human astrology reading.

02. The Environment

Set against "Thinking Pysanky"—faint, slowly drifting constellations that create a calm, contemplative auditory and visual space.

03. The Identity

`mba.robin.natally`

A persistent digital presence that maintains continuity of character across both local desktop and hosted web environments.

The Kintsugi Sequence

A meticulously paced onboarding experience. Big bold type paired with typewriter animations establishes a deliberate, thoughtful rhythm before the first spoken word.

Hello,
traveler.

Let's
align
your chart... 

The Conversational Heartbeat

Swiss Ephemeris Meets 3D Geometry

The Engine: Powered by detached Swiss Ephemeris sources (sweph-wasm) behind a unified EphemerisEngine.

The Visuals: Real cusps and aspects rendered through a rotating 3D torus alongside highly legible 2D charts.

The Output: Complex planetary math translated into casual, accessible speech by Natally.

The Astrological
Torus

Modern 2D
Astrological
Chart

The Lore Web: Shared Client-Side Memory

A local knowledge graph and vector store acting as the companion's long-term memory.

- **Embeddings:** all-minilm-l6-v2-q8_0.gguf (384 dimensions).
- **Mechanism:** Browser-local storage retrieves context and feeds it directly into the inference engine.
- **Privacy:** Complete export/delete controls remain strictly in the user's hands.

One Monorepo. Two Parallel Realities.

The engine powering Nattally is built on a dual-track architecture, allowing development for both local device inference and hosted cloud APIs simultaneously.

Architecture Matrix: Models & Execution

Category	Local / Device Edition	Hosted Web / API Edition
Companion Inference	[Staged] Qwen3-0.6B (q4_k_m.gguf). Native llama.cpp & WebAssembly (wllama).	[Required] Stronger server-side inference (Provider TBA).
Voice Generation (TTS)	[Staged] Kokoro-82M v1 (kokoro-v1-q8.onnx). Rust ONNX synthesis / Web Audio.	[Required] Higher-quality hosted speech generation APIs.
Speech Recognition (STT)	[Required] Device-local speech input.	[Required] Hosted recognition API.

Architecture Matrix: Features & Access

Category	Local / Device Edition	Hosted Web / API Edition
Offline Behavior	Target behavior allows charts, chat, and voice offline after initial asset installation.	Requires constant connectivity for hosted STT, TTS, and Inference.
Model Delivery	Manifest IDs, SHA-256 caching. App provisioning downloads local .gguf and .onnx files.	Weights remain on the server; API configuration handles delivery.
Payment & Access	Configurable trial to paid-unlimited via RevenueCat, Stripe, etc.	Metered pay-per-reading via APIs (Lightning/Alby, x402 workstream).

The Structured UI Pipeline

The UI Handoff Funnel

The Result: Identical screens, components, and companion interactions successfully routed into both parallel environments.

One Source, Two Realities

The magic of Natally is that she is not two separate apps.

By utilizing the **exact same exported UI source** and a **shared client-side Lore Web**, Natally remains a continuous digital companion. Her

“brain” seamlessly adapts to utilize local edge compute or ctul cloud APIs based entirely on the user’s environment—without ever breaking character.

Build & Delivery Targets

Open and Building in Parallel

The entire monorepo is currently governed under the AGPL-3.0-or-later license. We are building the future of conversational UI in public, staging models, and integrating engines today.

Explore the repository, review the architecture contracts, and help us build the definitive astrology companion.
